XLIV Rencontres de Moriond
QCD and High Energy Interactions
14-21 March 2009, La Thuile

1 e^+e^- Annihilation Processes

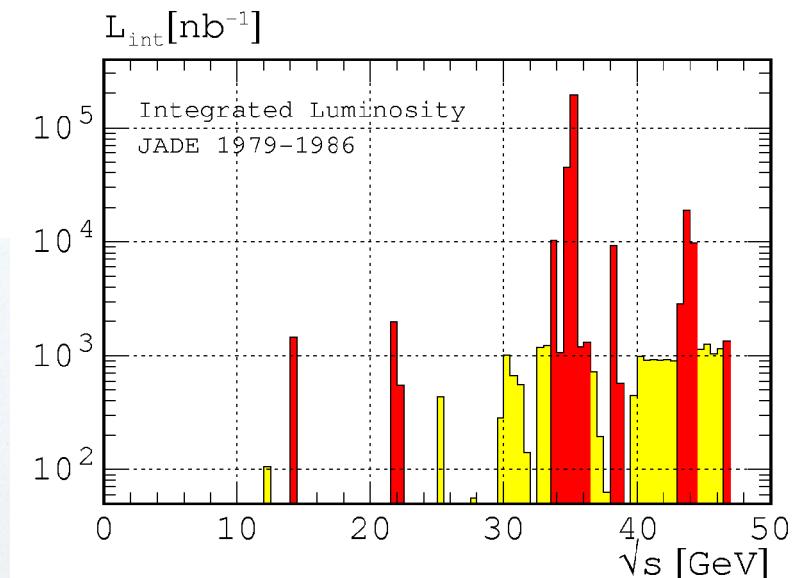

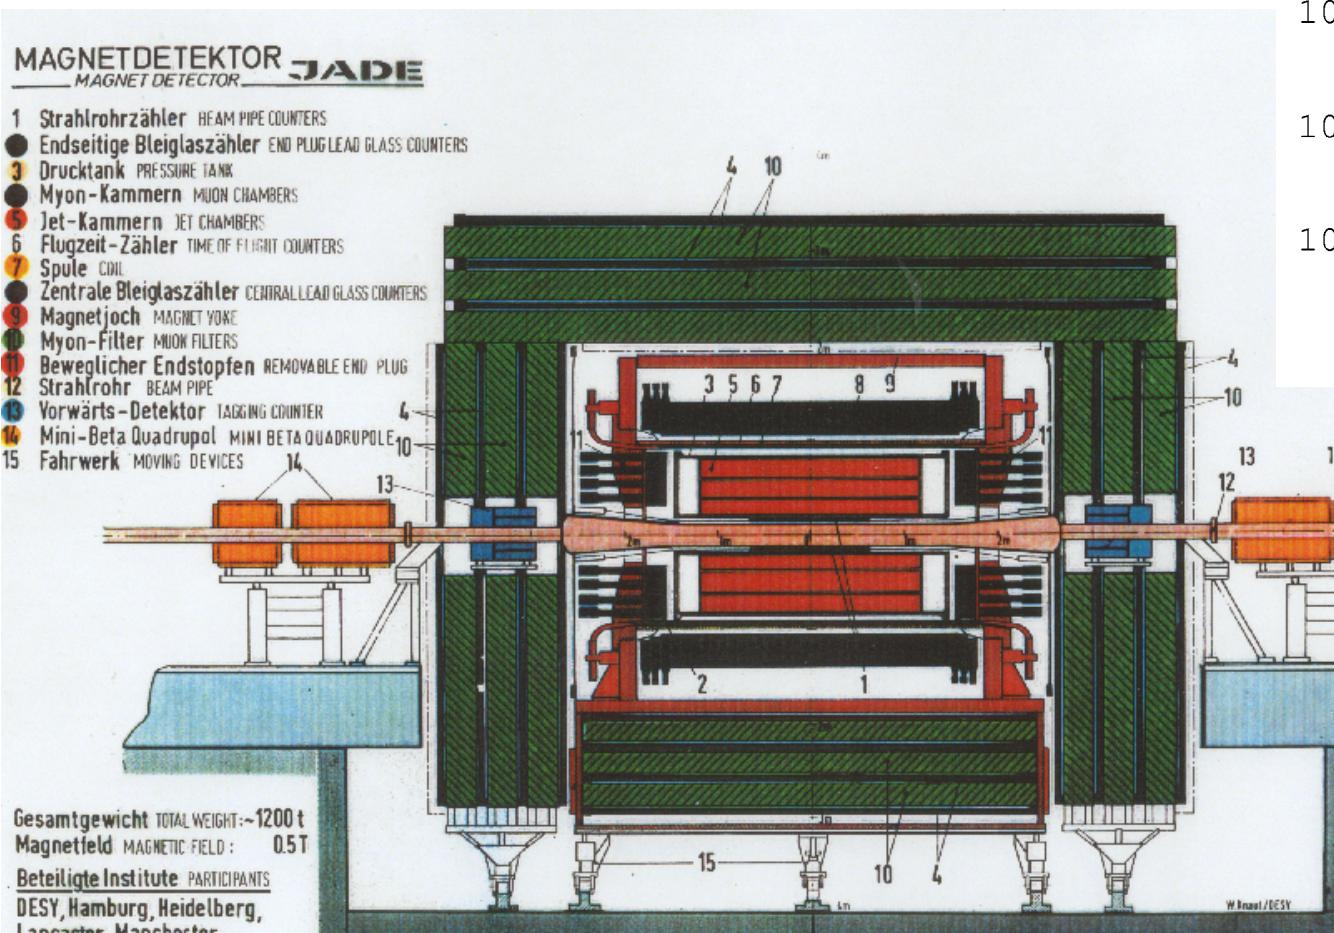

Main backgrounds
at PETRA:

$\gamma\gamma \rightarrow \text{hadrons}$
 τ pairs
ISR

1 JADE Experiment at PETRA

1979-1986, $\sqrt{s} = 14, 22, 35, 38, 44 \text{ GeV}$
re-analysis with modern tools

~ideal QCD experiment

larger lever arm in ln(s)
than LEP

no other data exist

Electro-weak Production

Parton Shower

Hadronisation

$d \bar{u} \}$ π^-
and many more
 u
 $d \bar{d} \}$ $\Lambda^0 \rightarrow \pi^- p^+$
 s
 $d \bar{c} \}$ $D^+ \rightarrow K^0 \pi^+$

Parton Level

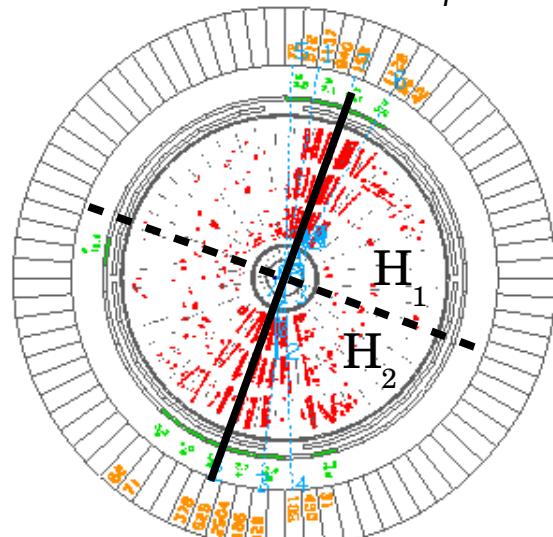

Hadron Level

Detector Level

2 Event Shape Observables

Thrust 1-T:

$$1-T = 1 - \max_{\vec{n}} \frac{\sum_i \vec{p}_i \cdot \vec{n}}{\sum_i |\vec{p}_i|}$$

Heavy Jet Mass M_H :

larger invariant mass in hemispheres

H_1 and H_2 w.r.t. thrust axis n

Jet Broadening B_T and B_W :

$$B_{1,2} = \frac{\sum_{i \in H_{1,2}} p_{t,i}}{2 \sum_i |\vec{p}_i|}$$

$$B_T = B_1 + B_2$$

$$B_W = \max(B_1, B_2)$$

C-parameter:

$$C = \frac{3}{2} \frac{\sum_{i,j} |\vec{p}_i| |\vec{p}_j| \sin(\Theta_{ij})}{(\sum_i |\vec{p}_i|)^2}$$

2 Event Shape: D_2 aka y_{23}

Durham (k_t) jet algorithm

$$y_{ij} = 2\min(E_i^2, E_j^2)(1 - \cos\theta_{ij})/s$$

MONTE CARLO R-FI SECTION
JADE

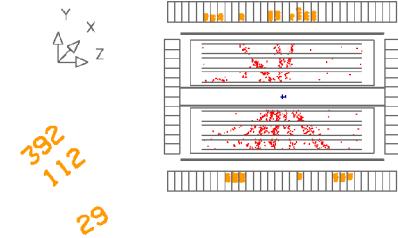

JADE MC event at 14 GeV

BEAM 7,000 GEV FIELD -4.849 KG TALC 0032 DATE 01/11/00 TIME 11.49.22
TRIG 0001 CAMAC TIME 1. 1. 1 17/ 7/1981

ANTI-U-QUARK

U-QUARK

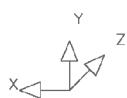

GLUON

iteratively combine pairs with
smallest y_{ij} ($\mathbf{p}_{jet} = \mathbf{p}_i + \mathbf{p}_j$)

$D_2 = y_{ij}$ for $3 \rightarrow 2$ jet transition
“differential 2-jet rate”

2 b-to-b partons: $D_2 = 0$
 ≥ 3 partons: $D_2 < 0.3$

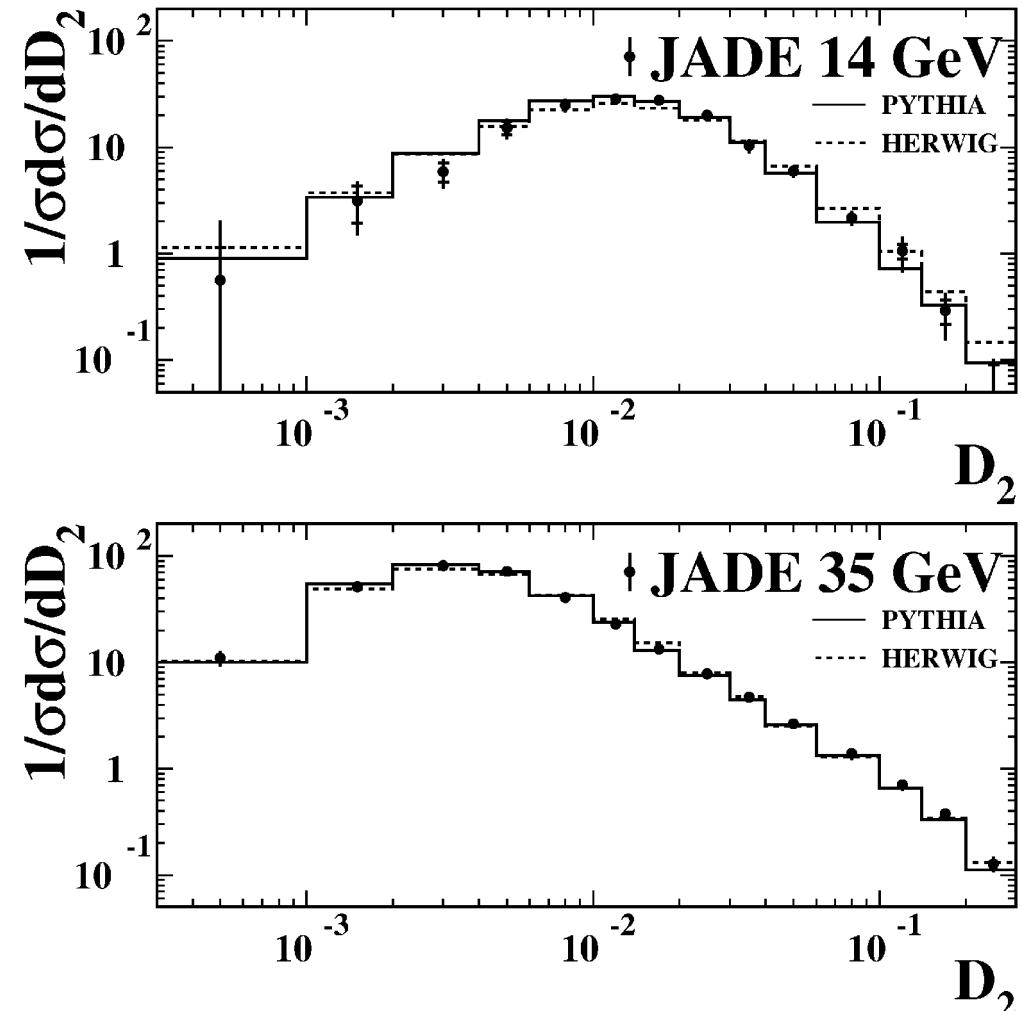

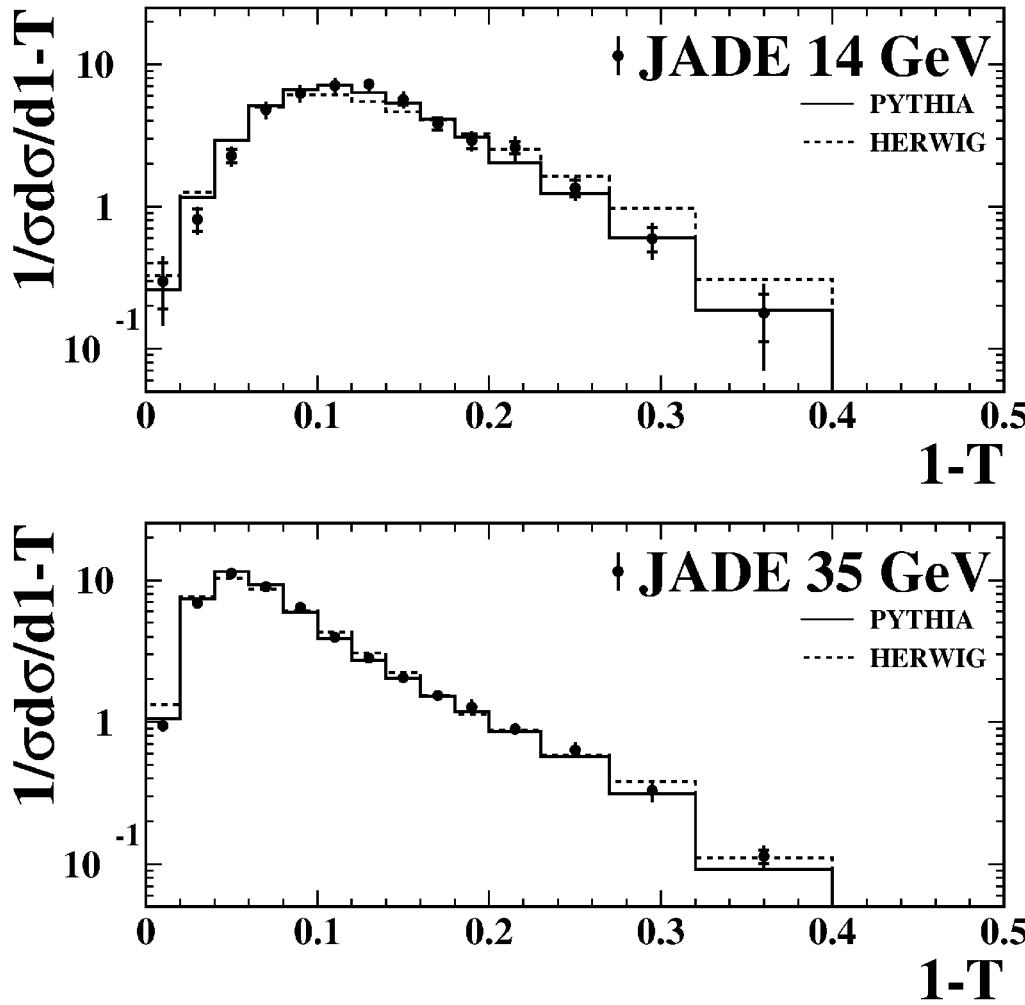

2 Event Shape Measurement

Measure $1-T$, M_H , B_T , B_W , C , D_2 to allow cross checks

Subtract expected $e^+e^- \rightarrow b\bar{b}$ contribution at detector level

Corrected data vs. modern MC \rightarrow good agreement justifies exp. corrections

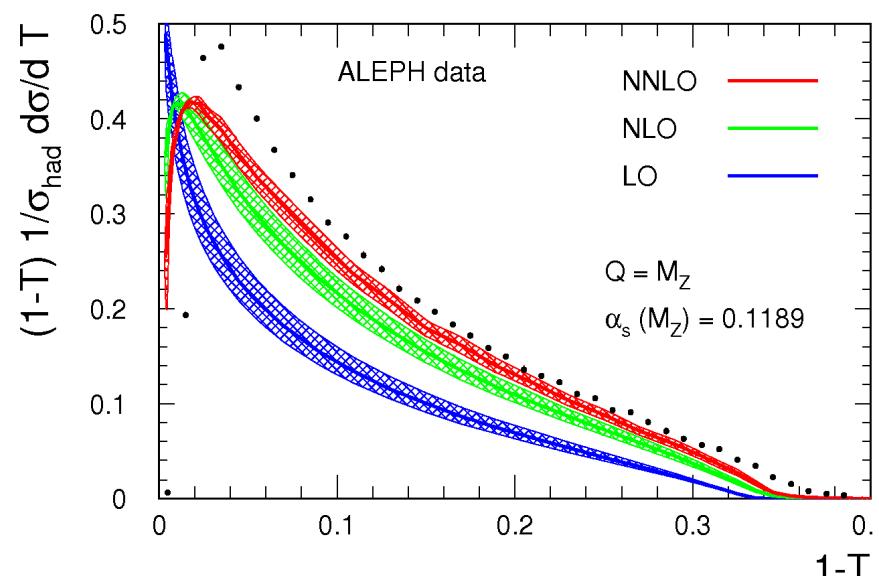

3 NNLO QCD

$$1/\sigma_0 d\sigma/dy(Q) = dA/dy \underline{\alpha}_s(Q) + dB/dy \underline{\alpha}_s^2(Q) + dC/dy \underline{\alpha}_s^3(Q)$$

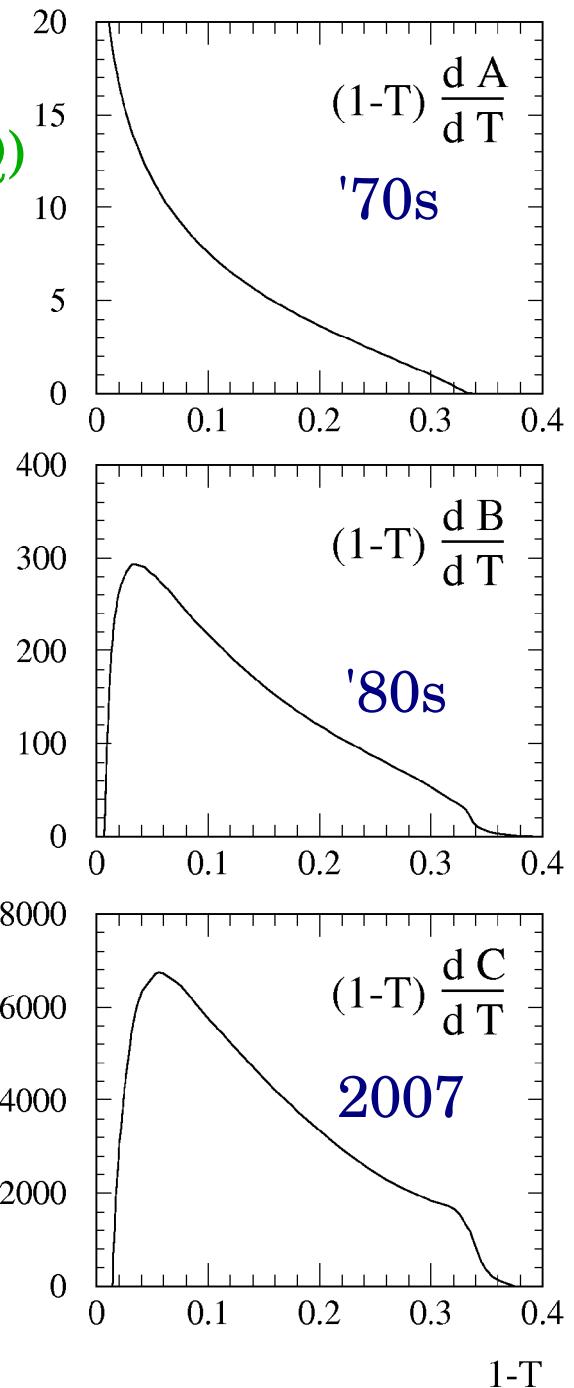

$y = 1-T, \dots; \underline{\alpha}_s = \alpha_s/(2\pi); \sigma_0 \rightarrow \sigma_{\text{had}}$, scale dep. not shown

dA/dy etc. from phase space integration of **QCD ME**
 (very difficult, NNLO from GGGH, JHEP 0712:094)

NLLA matching from GLS PLB664(2008)265

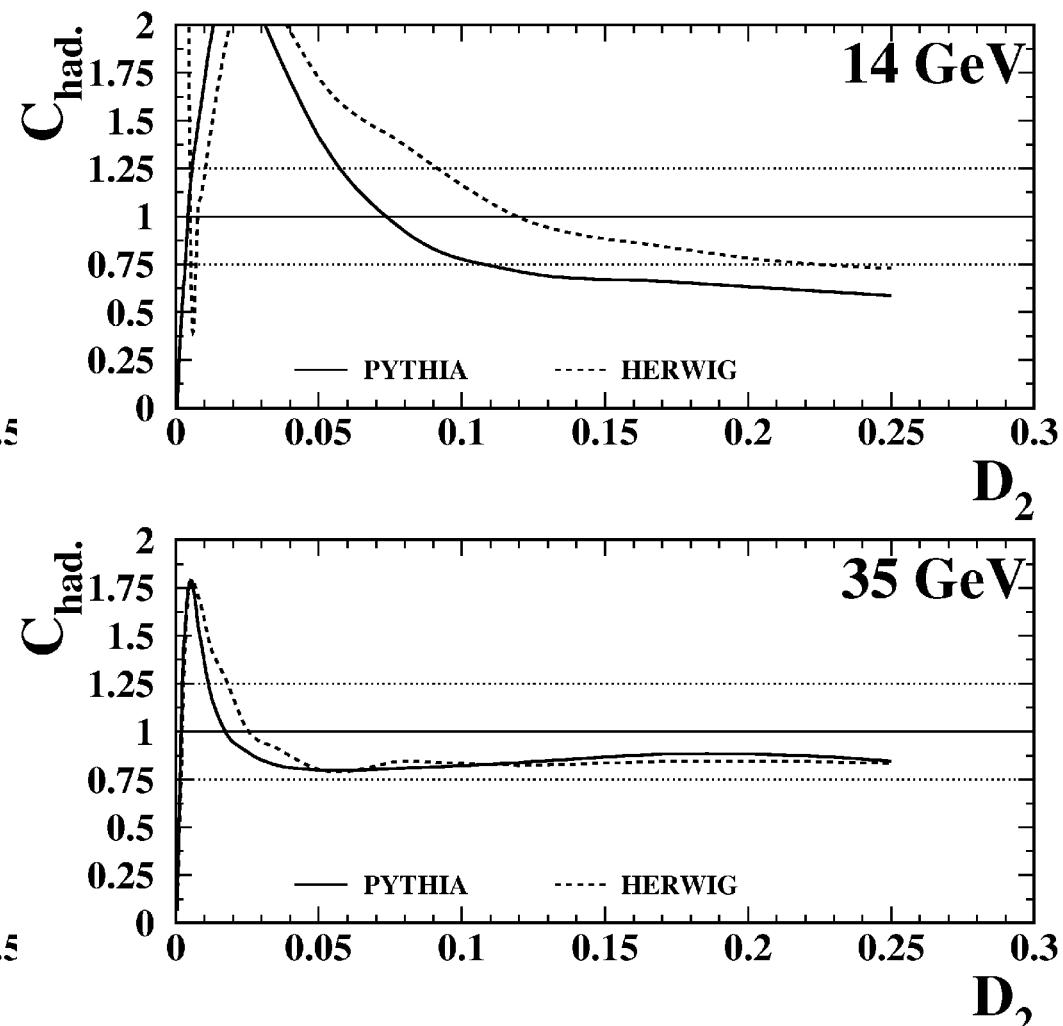

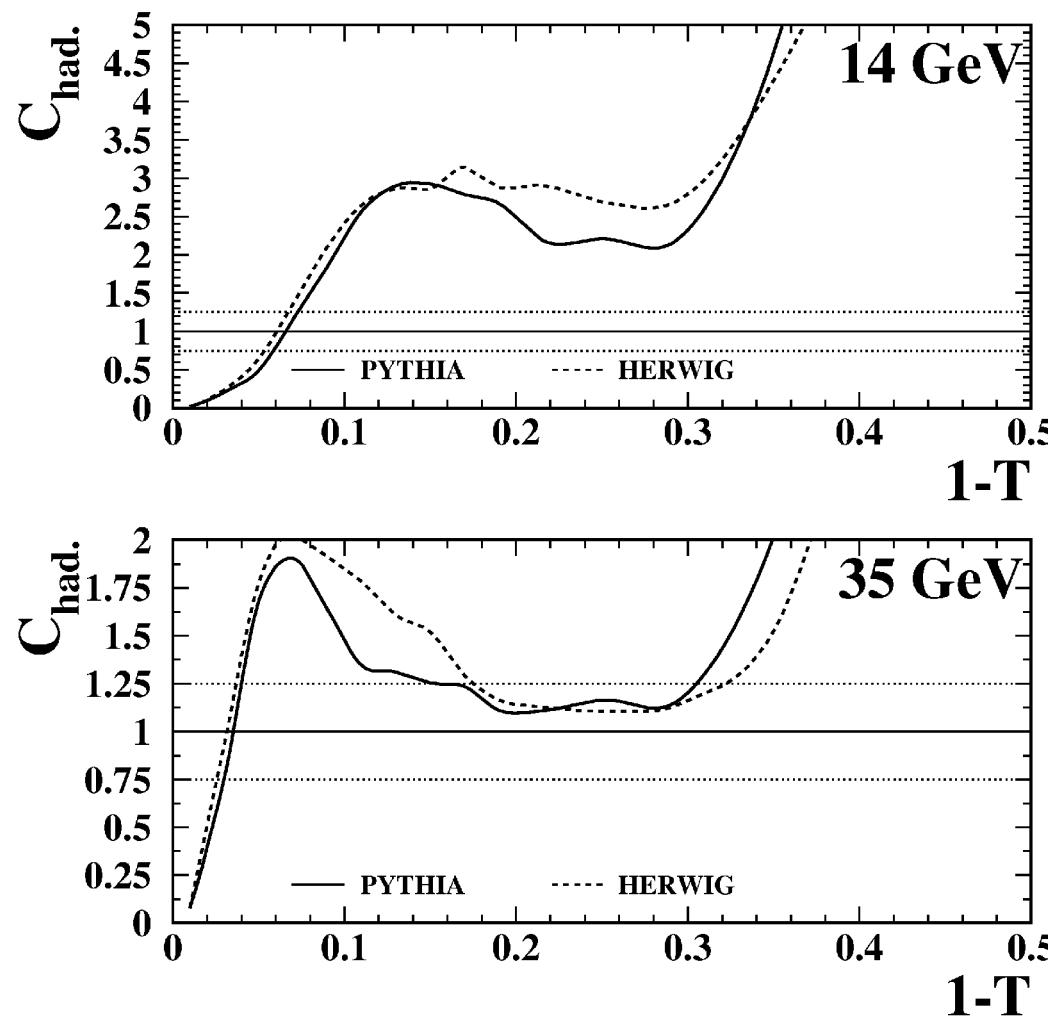

$\alpha_s(M_Z)$ from JADE Event Shapes

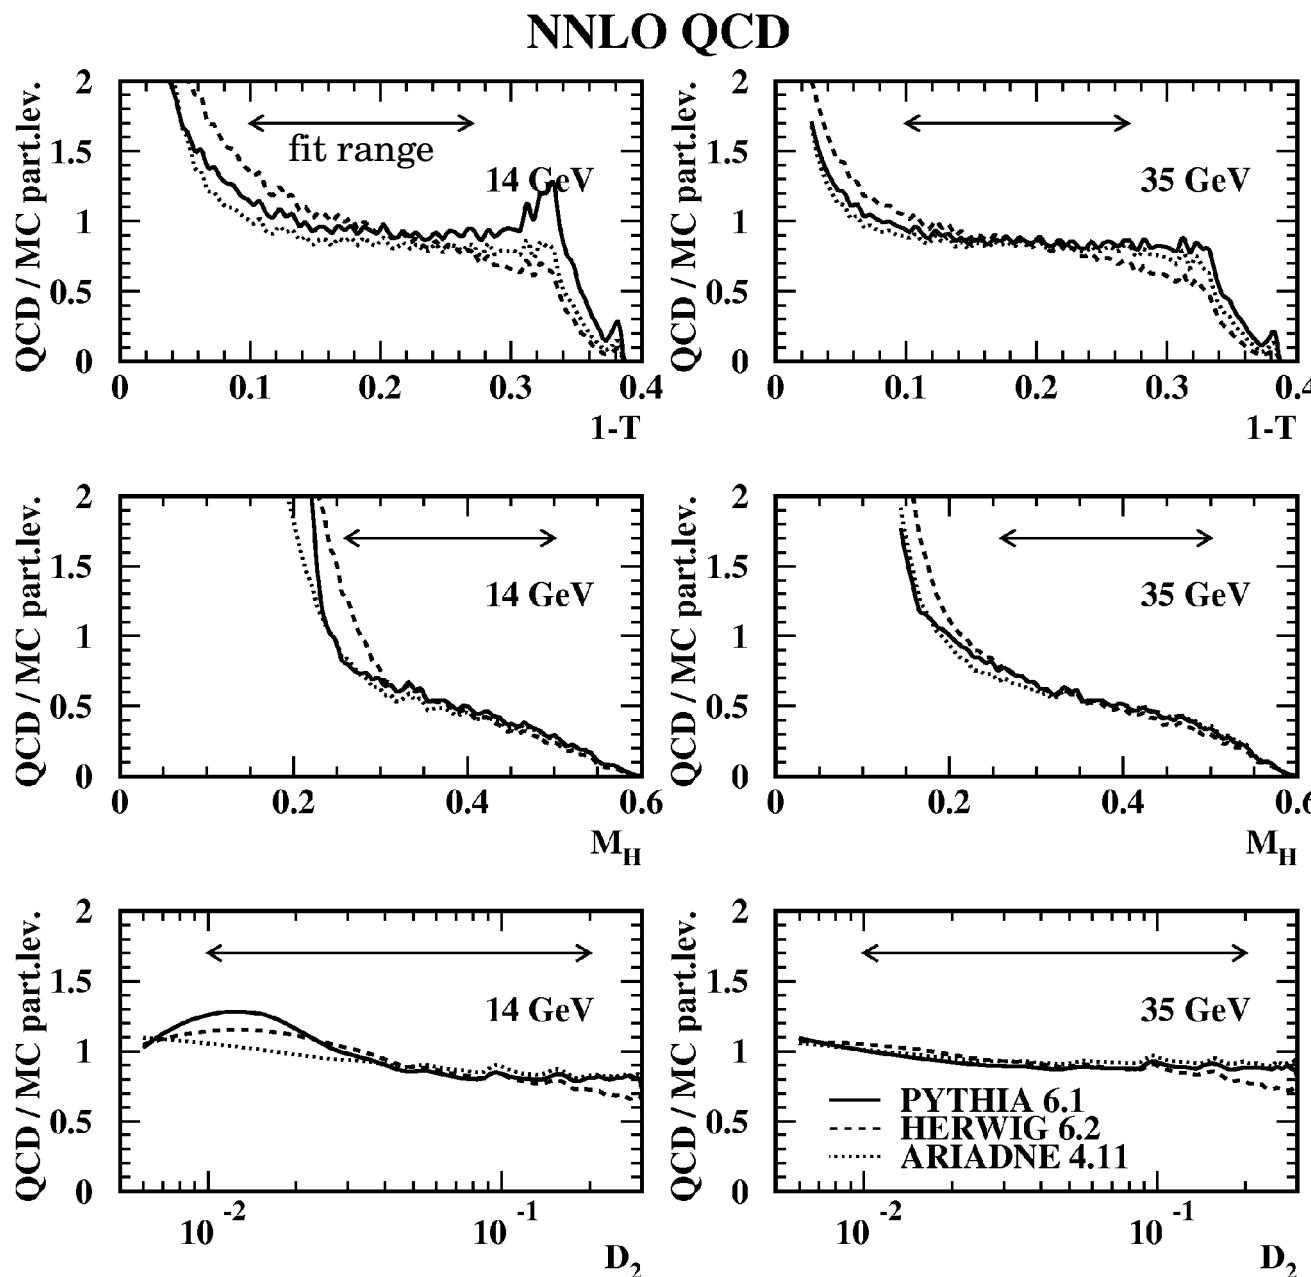

3 NNLO(+NLLA) fits

MC hadronisation corrections $C_{\text{had.}} = d\sigma_{\text{had}} / d\sigma_{\text{part}}$

Analysis corrects cum. dist. $R(y) = \int_0^y 1/\sigma d\sigma/dy' dy'$ (norm. correct)

3 NNLO(+NLLA) Fits

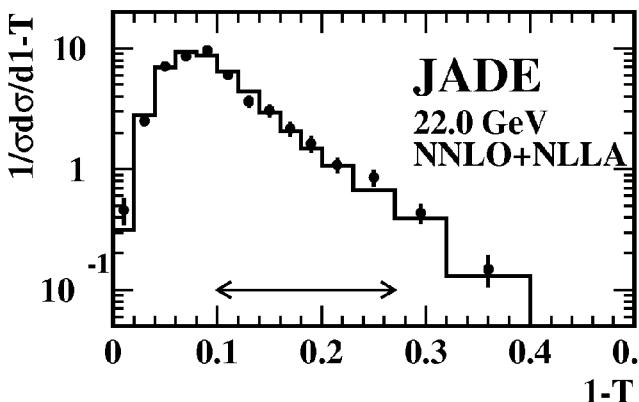

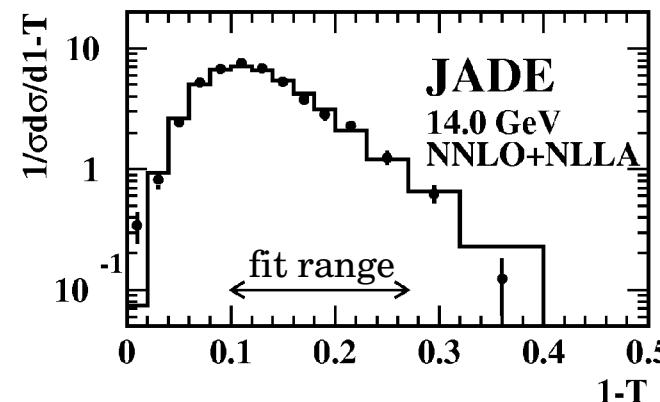

Check consistency
 QCD \leftrightarrow MC parton-level
 $(\alpha_s(M_Z) = 0.118)$

Generally ok within
 model differences,
 except M_H

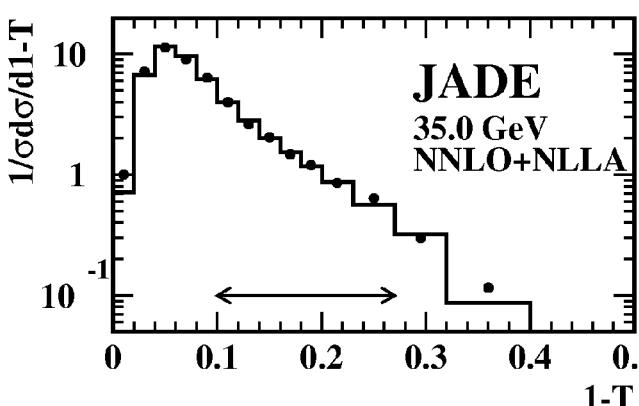

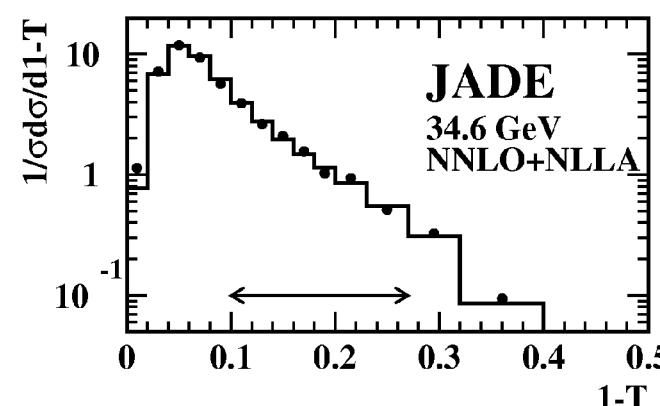

\Rightarrow bias on α_s not covered
 by had. systematic?

3 NNLO(+NLLA) Fits

Fit ranges:

det. corr. stable && $< 20\%$
had. corr. stable && $< 50\%$
(except 14 GeV)

theory stable:

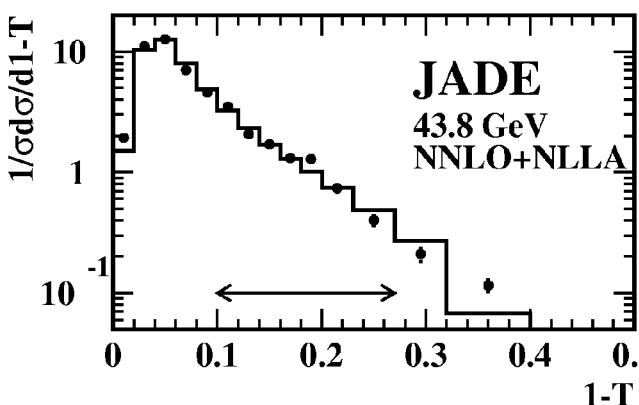

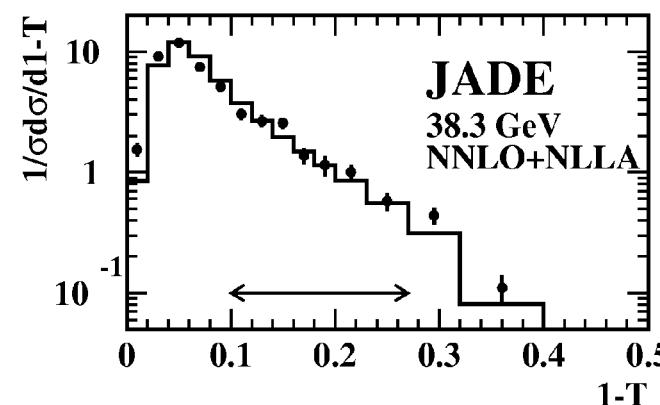

$$\alpha_s \ln(1/y)/y < 0.3 \Rightarrow y_{\min}$$

3-parton PS only $\Rightarrow y_{\max}$

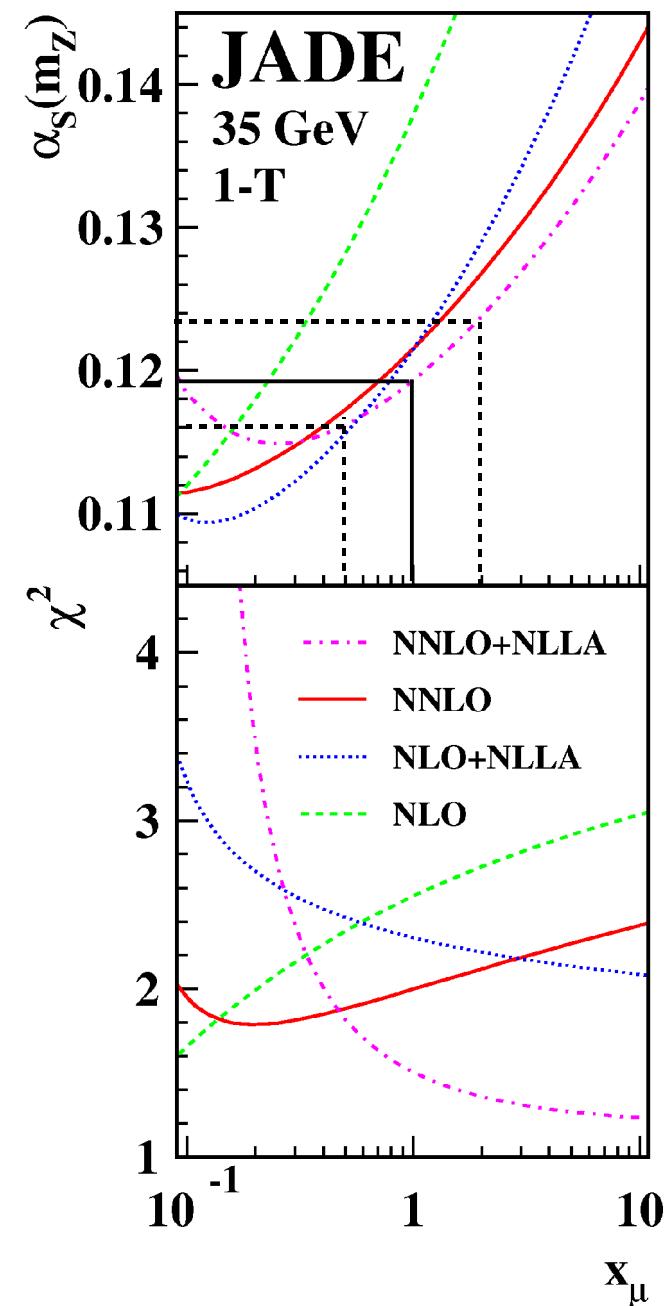

Binned χ^2 -fits incl. stat.corr.

$$1.3 < \chi^2/\text{d.o.f} < 3.0$$

Other observables similar
 $\chi^2/\text{d.o.f} < 3.0$

3 NNLO(+NLLA) Fits

NNLO:

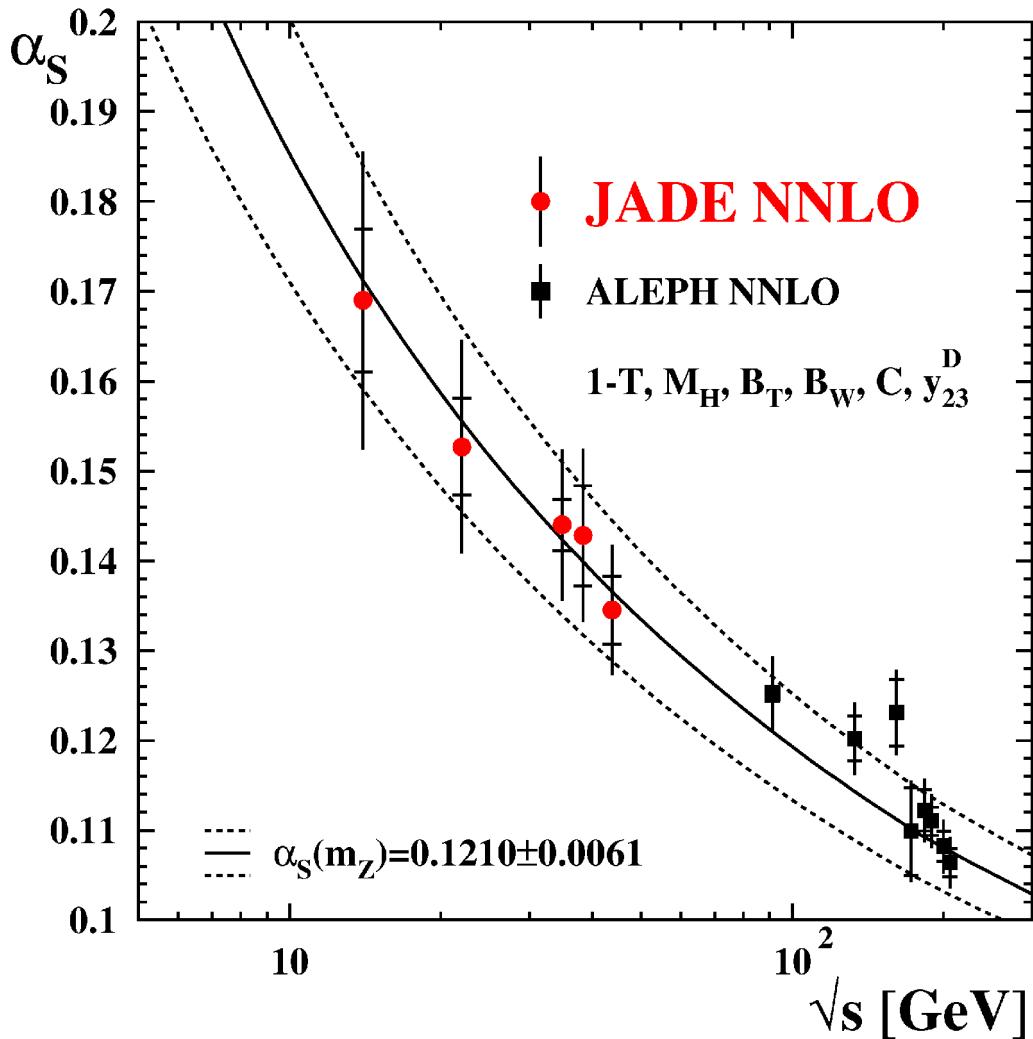

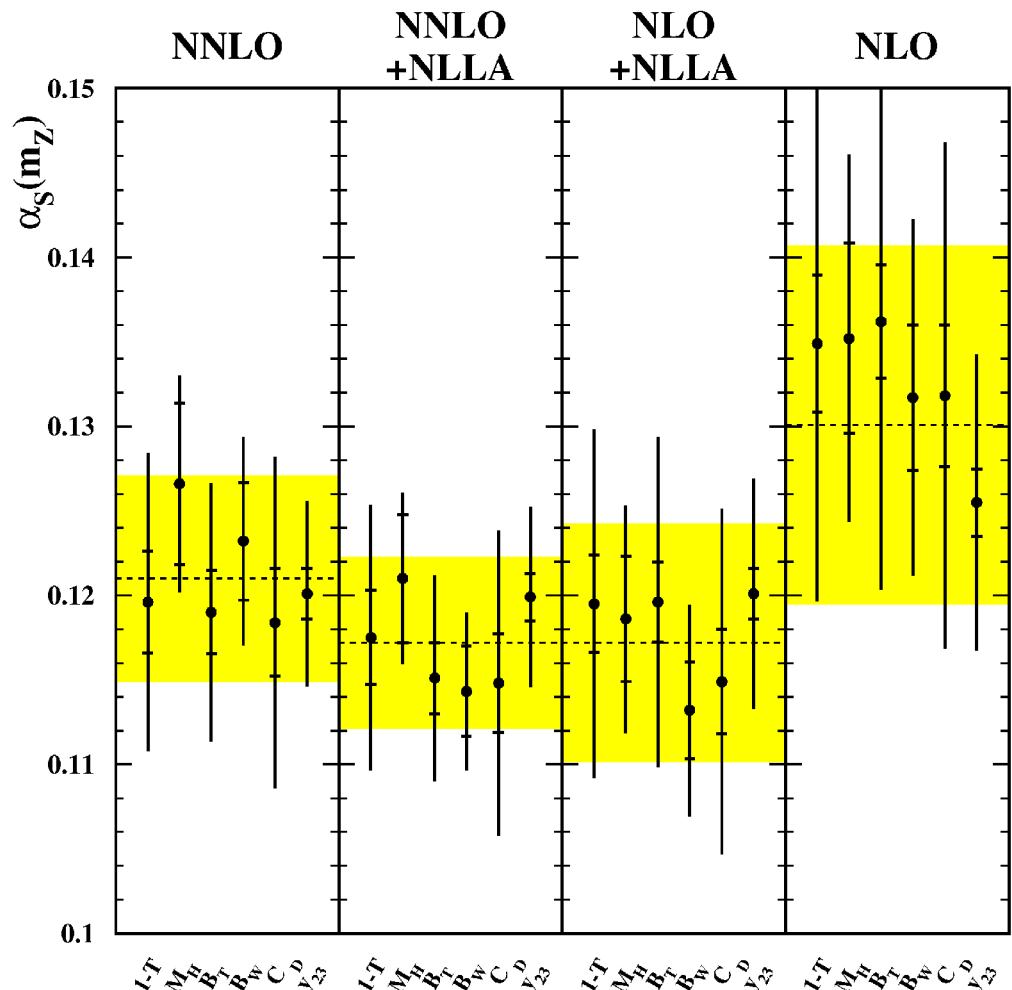

$$\begin{aligned} \alpha_s(M_Z) &= 0.1210 \pm 0.0007(\text{stat.}) \pm 0.0021(\text{exp.}) \\ &\quad \pm 0.0044(\text{had.}) \pm 0.0036(\text{theo.}) \\ &= 0.1220 \pm 0.0061(\text{tot.}) \end{aligned}$$

NNLO+NLLA:

$$\begin{aligned} \alpha_s(M_Z) &= 0.1172 \pm 0.0006(\text{stat.}) \pm 0.0020(\text{exp.}) \\ &\quad \pm 0.0035(\text{had.}) \pm 0.0030(\text{theo.}) \\ &= 0.1172 \pm 0.0051(\text{tot.}) \end{aligned}$$

Results w/o M_H consistent, slightly larger (14-20%) had. systematics
theo. error smaller by factor ~2 (NLO+NLLA) or ~3 (NLO)

3 NNLO(+NLLA) Fits

$4 \alpha_s(M_Z)$ in NLO from Moments

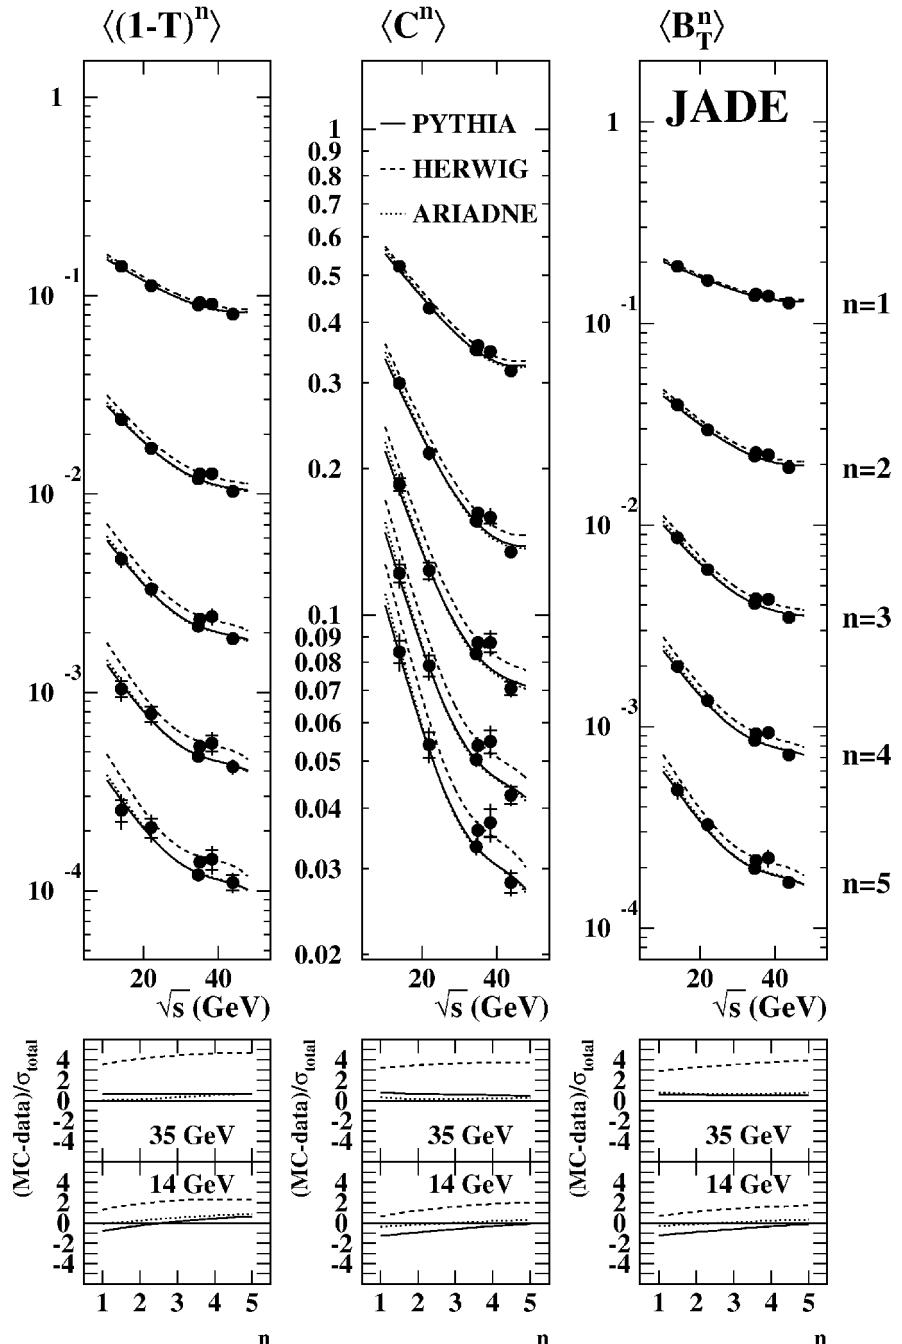

Moment of event shape distributions

$$\langle y^n \rangle = \int y^n \frac{1}{\sigma} d\sigma/dy' dy'$$

Always probe full phase space

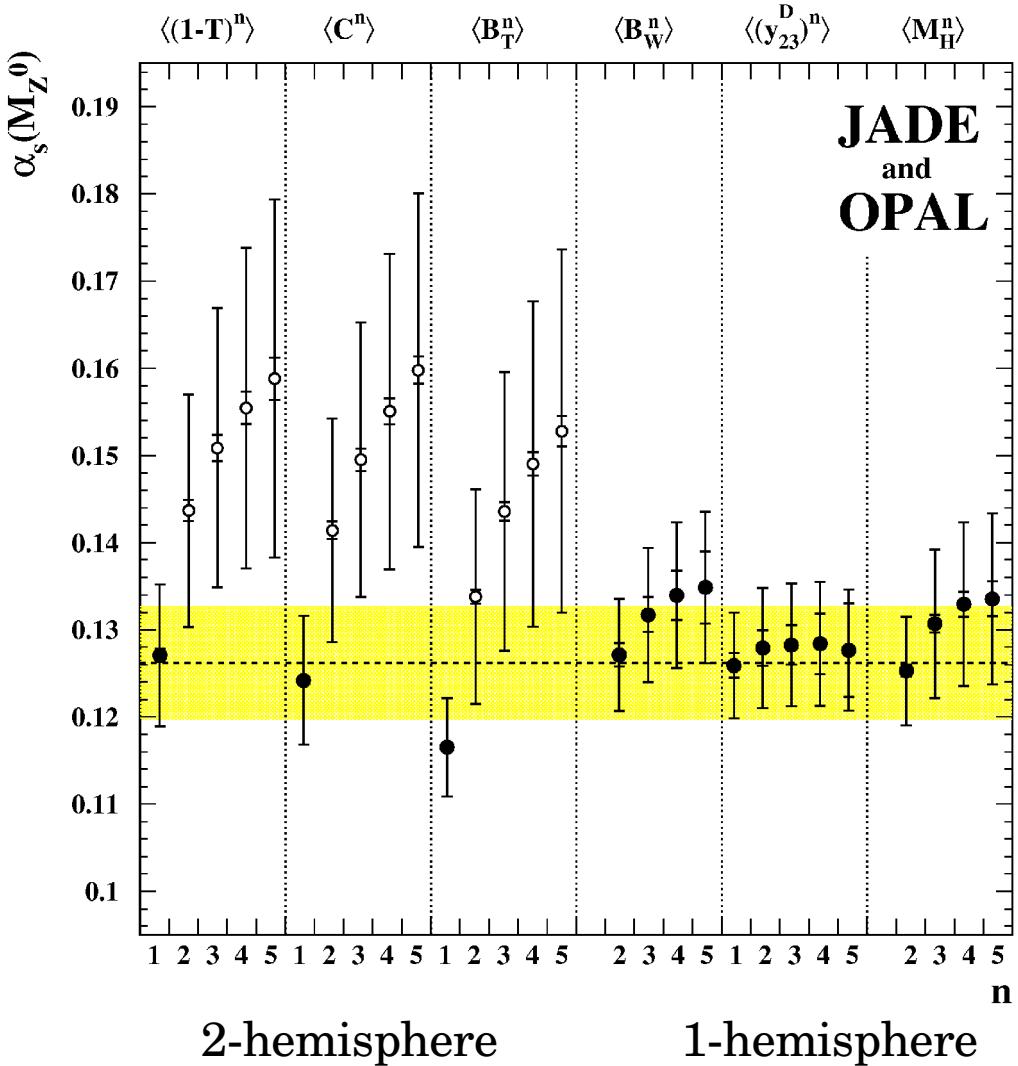

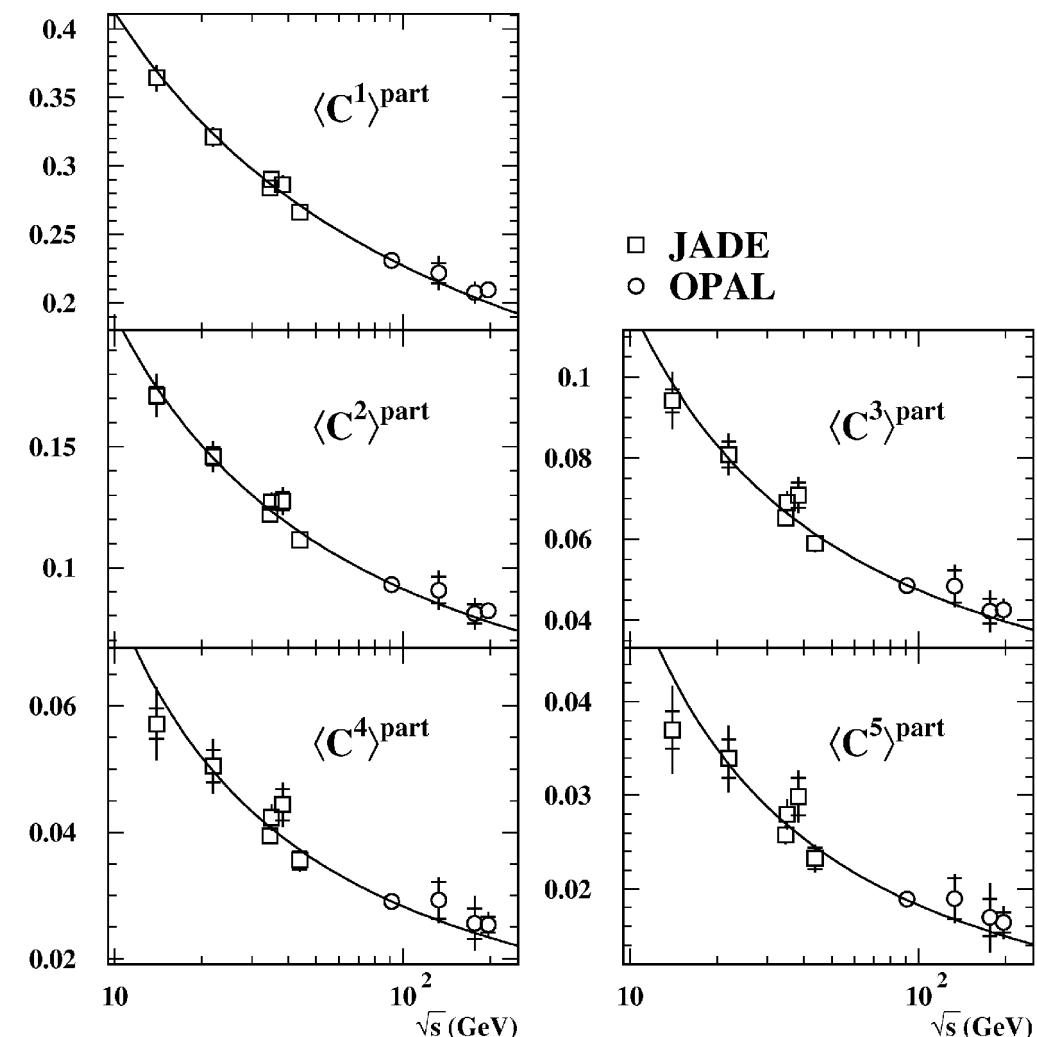

NNLO QCD not yet
 (GGGH vs. Weinzierl PRL101(2008)162001)

Had. corrections with MC

$\alpha_s(M_Z)$ from JADE Event Shapes

$4 \alpha_s(M_Z)$ in NLO from Moments

$$\begin{aligned} \alpha_s(M_Z) = & 0.1287 \pm 0.0007(\text{stat.}) \pm 0.0011(\text{exp.}) \\ & \pm 0.0022(\text{had.}) \pm 0.0075(\text{theo.}) \end{aligned}$$

5 Summary

- First NNLO+NLLA event shape analysis
- Precision measurement $\Delta\alpha_s(M_Z) \sim 4\%$
 - Problems with M_H ?
- Results from moments (NLO) consistent
- To come:
 - NNLO(+NLLA) with OPAL
 - NNLO moments
 - Analytic power correction models with moments

3 NNLO Fits

Rel. deviations between $\alpha_s(M_Z)$ fit results for different fits:

[%]	1-T	M_H	B_T	B_W	C	D_2
NNLO-NLO	-13	-7	-14	-7	-11	-4
NNLO-(NLO+NLLA)	0.1	7	-0.5	8	3	0
(NNLO+NLLA)-	-2	2	-4	1	0	-0.2
(NLO+NLLA)						

RMS of combined observable $\alpha_s(M_Z)$ results for different fits:

[%]	NNLO	NNLO+NLLA	NLO	NLO+NLLA
RMS	2.9	2.6	3.6	2.6

RMS reduction less than at LEP \rightarrow hadronisation systematics
